

DE ROSA

TITANIO

WHERE THE ROADS MEET.

FEEL YOUR HEART

TITANIUM A TIMELESS CHOICE.

There are materials that follow trends, and materials that move beyond them.

Titanium belongs to the latter.

It is not designed to impress, but to endure.

It doesn't chase trends it outlasts them.

In the world of cycling, titanium represents a conscious choice, almost countercultural: a noble material, complex to work with, demanding deep expertise, experience, and a clear vision.

This is why, over time, it has become a statement of intent rather than a mere technical option.

Its uniqueness lies in balance: structural lightness, fatigue resistance, controlled elasticity, and a natural ability to absorb vibrations.

Qualities that remain consistent, kilometer after kilometer.

Choosing a titanium bike means choosing a machine that does not fear time neither mechanically nor aesthetically.

CRAFTSMANSHIP AND VISION.

Titanium has been part of De Rosa's workshops for over thirty years.

A material that has accompanied the brand's evolution, becoming increasingly central over time, until it turned into one of the clearest symbols of its artisanal expertise.

Along this path, models such as Titanio X represent the most recent and mature expression of a constantly evolving tradition a conscious reinterpretation of it.

Each frame is born from a fully artisanal process, crafted by hand, one at a time, at the headquarters in Cusano Milanino.

From tube preparation to the final weld, every step takes place in-house, under the eyes of those who know the material intimately and respect both its limits and its potential.

For us, hand welding is a clear statement.
It means total control over the process, but above all, absolute attention to detail. Every joint is the result of experience, sensitivity, and precision.

This philosophy takes shape in the Black Label program: the highest expression of De Rosa's manufacturing excellence. A tailor-made approach that places the rider at the center of the creative process, giving life to Made to Measure frames designed to adapt to the body, the riding style, and the ambitions of those who will ride them.

A TIMELESS CHOICE.

A BIKE TAILORED TO MEASURE.

Like a bespoke haute couture garment.

Personalization begins with geometry: the frame is designed around the rider's real needs their way of riding, their goals, and the intended use. Road, gravel, long distances or pure performance: the project takes shape around the person who will ride it.

And it doesn't stop there.

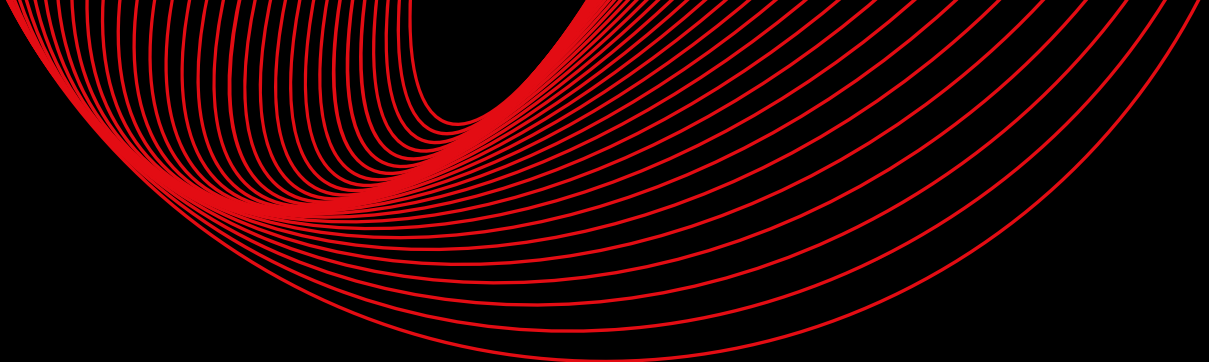

Finishes, details, build specifications, construction solutions, and aesthetic choices all become an integral part of the process, transforming the bicycle into a rare and deeply personal object.

And if desired, it is possible to witness the birth of your own bike: to see the frame take shape, observe the welds, ask questions, and understand every step.

For us, this is how we build a direct, transparent, and human relationship.

The result is a bicycle capable of adapting, interpreting, and accompanying its rider whichever direction they choose to take.

Titanio X is born at a precise point: where roads stop being a forced choice and become pure enjoyment.

It is a bicycle conceived for a new era, where the route is no longer linear and directions are never singular.

Its name holds the deepest meaning of the project.

X stands for a crossroads or better yet, a meeting point.

A symbolic place where two different souls recognize and complete each other.

On one side, a road-oriented nature, defined by smoothness, rhythm, and precision. On the other, an off-road vocation, open to the unexpected, to gravel, to discovery.

With Titanio X, road and gravel no longer compete for the route. They find balance.

At the heart of the project is titanium.

A material that neither follows trends nor fears time, chosen for its structural and dynamic qualities. Controlled elasticity, fatigue resistance, vibration-absorbing ability, and long-lasting durability make titanium ideal for versatile use on both road and gravel.

In Titanio X, the material is not just a technical choice, but a statement of intent: to deliver consistent ride quality, comfort over long distances, and reliability in every condition. It is a bicycle that invites you to change surface, pace, and direction while always maintaining the same predictable performance.

The Material

The titanium frame of the Titanio X is paired with a carbon fork designed to enhance steering precision, front-end control, and responsiveness especially when the surface becomes uneven.

A solution that strengthens confidence and stability without compromising ride sensitivity.

The Geometry

It results from a careful balance between stability and responsiveness. The setup allows for long road rides in a natural and efficient position, while simultaneously ensuring control and confidence on mixed surfaces.

The steering angle on larger sizes is more relaxed, improving high-speed stability and confidence on gravel, while the compact rear triangle keeps the bike agile and responsive to changes in pace, even on tarmac. The progressive reach allows an efficient position without compromising the setup.

Recommended Setup

The recommended setup fully expresses this philosophy: a 3D-printed UDH dropout and Campagnolo 1x13 wireless groupset the high-performance gravel-specific drivetrain paired with Bora X wheels.

A configuration designed to tackle climbs, flats, and descents with the same confidence, from the Stelvio Pass to the Strade Bianche.

It is also compatible with the main groupsets available on the market.

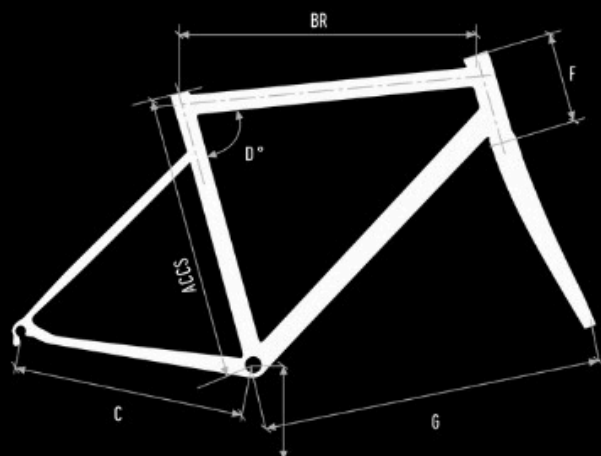

DESIGNED BALANCE, TAILORED FREEDOM.
